2 Overall Description

2.1 Product perspective and context

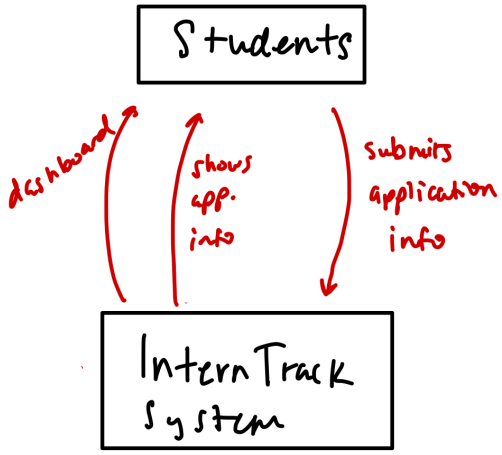

▸ **WHAT GOES HERE**

Draw the context diagram: one box for your system, every external actor and external system around it, and a labelled line for each interface. Paste the image here.

This is the diagram that decides what you are responsible for. Anything inside the box is your work. Anything you call on and do not build is an external system — and it still goes on the diagram.

Budget: one diagram and one paragraph explaining the boundary choice.

Subject to change: this current context diagram represents everything the application has to do, which is to track, store and display internship application progress. The only external actor for us currently is the user, as even though advisors, recruiters and developers have stakes in this application, they are either not directly receiving information (recruiters, advisors), or are inside of the system (developers). However, we acknowledge that our scope can change. For now, the only external actor we are taking into account when designing this context diagram is the user/student.

2.2 Stakeholders and how you reached them

▸ **WHAT GOES HERE**

Everyone whose needs shape the system, including the ones who will never use it — whoever pays, whoever operates it, whoever has to comply with something because of it.

The last column is the one that earns marks. “We assumed” is an honest and acceptable answer at P1; “interviewed on 9 Oct, notes in /docs/elicitation” is a better one. An entry with no basis at all is not.

Stakeholder	Role in relation to the system	What they need from it	How you learned this
Students	User who creates, and manages their applications. Primary user	Internship application history tracked in one place, with statuses (applied, interviewing, rejected, offered) for each application.	We assumed so from our own experiences, as the entire purpose of the app is to cater to students applying for internships.
University Advisors	Views student application progress and gives advice using what application shows	Clear, visible application history data in order to make it easy for them to make proper judgement on what a student should do to enhance their job prospects.	We assumed so, from our own experiences with career advisors, and progress being hard to show without an easy to see record. Planned contact with university advisor, subject to change needs.
Employers/Recruiters	Indirect stakeholder: not using the system, but affected by students tracking applications through it.	Students being honest and able to track their own application history, as users might apply to employer companies. Possibly keeping track if they have applied to their company, no double applications.	We assumed so from our experiences regarding the hiring and internship process, through our experiences speaking with recruiters at career fairs, and common recruiter grievances regarding the process.
Developers	Builders and later maintainers of both application and system.	Requirements clear and concise, agreed upon and streamlined development process, ability to add features without needing to majorly rework system.	We assumed so, as we are the ones that will be developing this application and we want to make the development process as smooth as possible.

2.3 User characteristics

▸ **WHAT GOES HERE**

Who the users are, what they already know, what they cannot be assumed to know, and anything about them that constrains the system — accessibility needs, the device they will be holding, the hurry they are in.

Budget: a short paragraph per user class.

Although students will be using the app for the same reasons (tracking internship applications and their progress), we must take into account that different kinds of students will be using this application.

1. Students newer to the application process: likely to not fully know how the application process works. They might not know how long until a follow up, the stages of the application process, or the fact that many apps do not get a response at all. It's imperative that our app streamline and display this information in a concise manner for easier use and to not feel overwhelming.

2. Experienced applicants: students who are more familiar with the application process. These students, once using the application, are likely to update their progress and add new entries at a much faster rate than the inexperienced. Adding and changing statuses of applications must be quick and take a few taps or clicks at most.

Generally, for every user, the application must have a clean user interface and user experience (as we will also have a dashboard). Text should be readable, color should fit the message the interface is trying to convey. Also assumed students do not want their information being shared.
