1 Introduction

1.1 Purpose of this document and of the system

This document explains the project proposal and requirements for InternTrack, an Internship Application Management System. It describes the purpose of the project, the problem it helps to solve, the main features, user requirements, and possible challenges. It also explains how our team plans to develop the system

InternTrack is a web-based application system that is designed to help students keep track of their internship applications. Students often apply to internships through different company websites, which can sometimes make it difficult to remember application statuses, interview dates, and deadlines. InternTrack will help solve this problem by allowing students to save their applications, update their statuses, keep track of important dates, and view their overall progress in one place.

1.2 Scope

In scope — we will build this	Out of scope — we will not, and why
Allow students to create accounts and log in	University login systems because they require permission from the university
Create, view, edit and delete application	Automatically apply to internships because it requires access to company websites
Track status and status-change history(Applied, Interviewing, Offered, or Rejected)	Automatically check application statues because it would require connecting to other websites
Save interview dates and application deadlines	Automatically schedule interviews with employers because students will arrange interview themselves
Show reminders for upcoming deadlines	Send email or text reminders because they require outside services
Show application progress on a dashboard	Use AI to recommend internships because our main goal is to help students track their application
Search and filter internship applications	Automatically collect internship listings because it would require access to other job websites
Save resume and cover letter	Create or edit resumes and cover letters because students will upload documents they have already prepared

We excluded these features because some would require access to other websites or take more time to develop and test. Since this project must be completed within one semester, we want to focus on building the main features first. Our goal is to create a system that helps students to organize their internship applications, keep track of important dates, and view their progress all in one place. By focusing on these features, we can make sure the system is functional, easy to use, and completed within the project timeline.
